

# SEA-ICE SIGNATURE IN SWIM OFF-NADIR ECHOES

Sea-ice flagging

Charles Peureux, Jean-Jacques Estimbre, Nicolas Longép , Annabelle Ollivier  
and CaSys team (CLS)

Alexis Mouche, Fanny Girard-Ardhuin and LOPS team (IFREMER)

Jean-Michel Lachiver, C line Tison and C dric Tourain (CNES)

SWIM Science Team Meeting - 18 March 2021

09:45

## ***Current status:***

No component SWIM ↔ sea-ice in CWWIC (CNES)  
SWIM processing chains

## **While...**

- Sea ice can “pollute” wave field retrieval
- Wave measurements in sea ice regions of potential interest

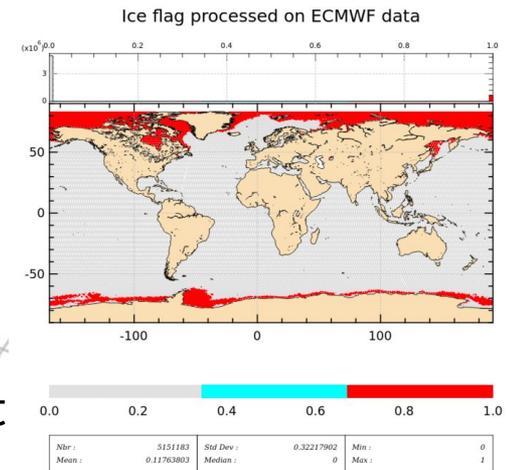

## **While...**

- Previous SWIMSID study over GPM data

## **Objective:**

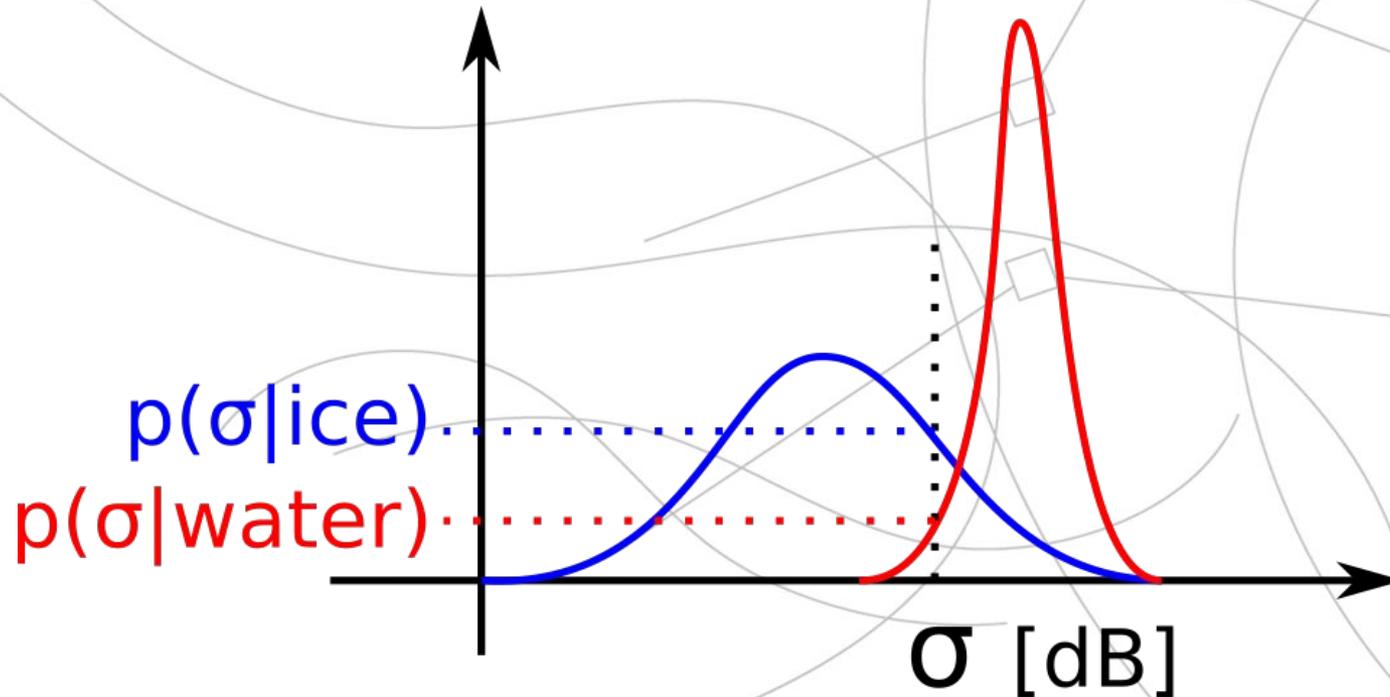

With CFOSAT now flying, commissioned and data validated,

- 1) design a sea ice flag at the L1a level
- 2) prototype sea ice products from SWIM data (L1a, L2 ... ?)

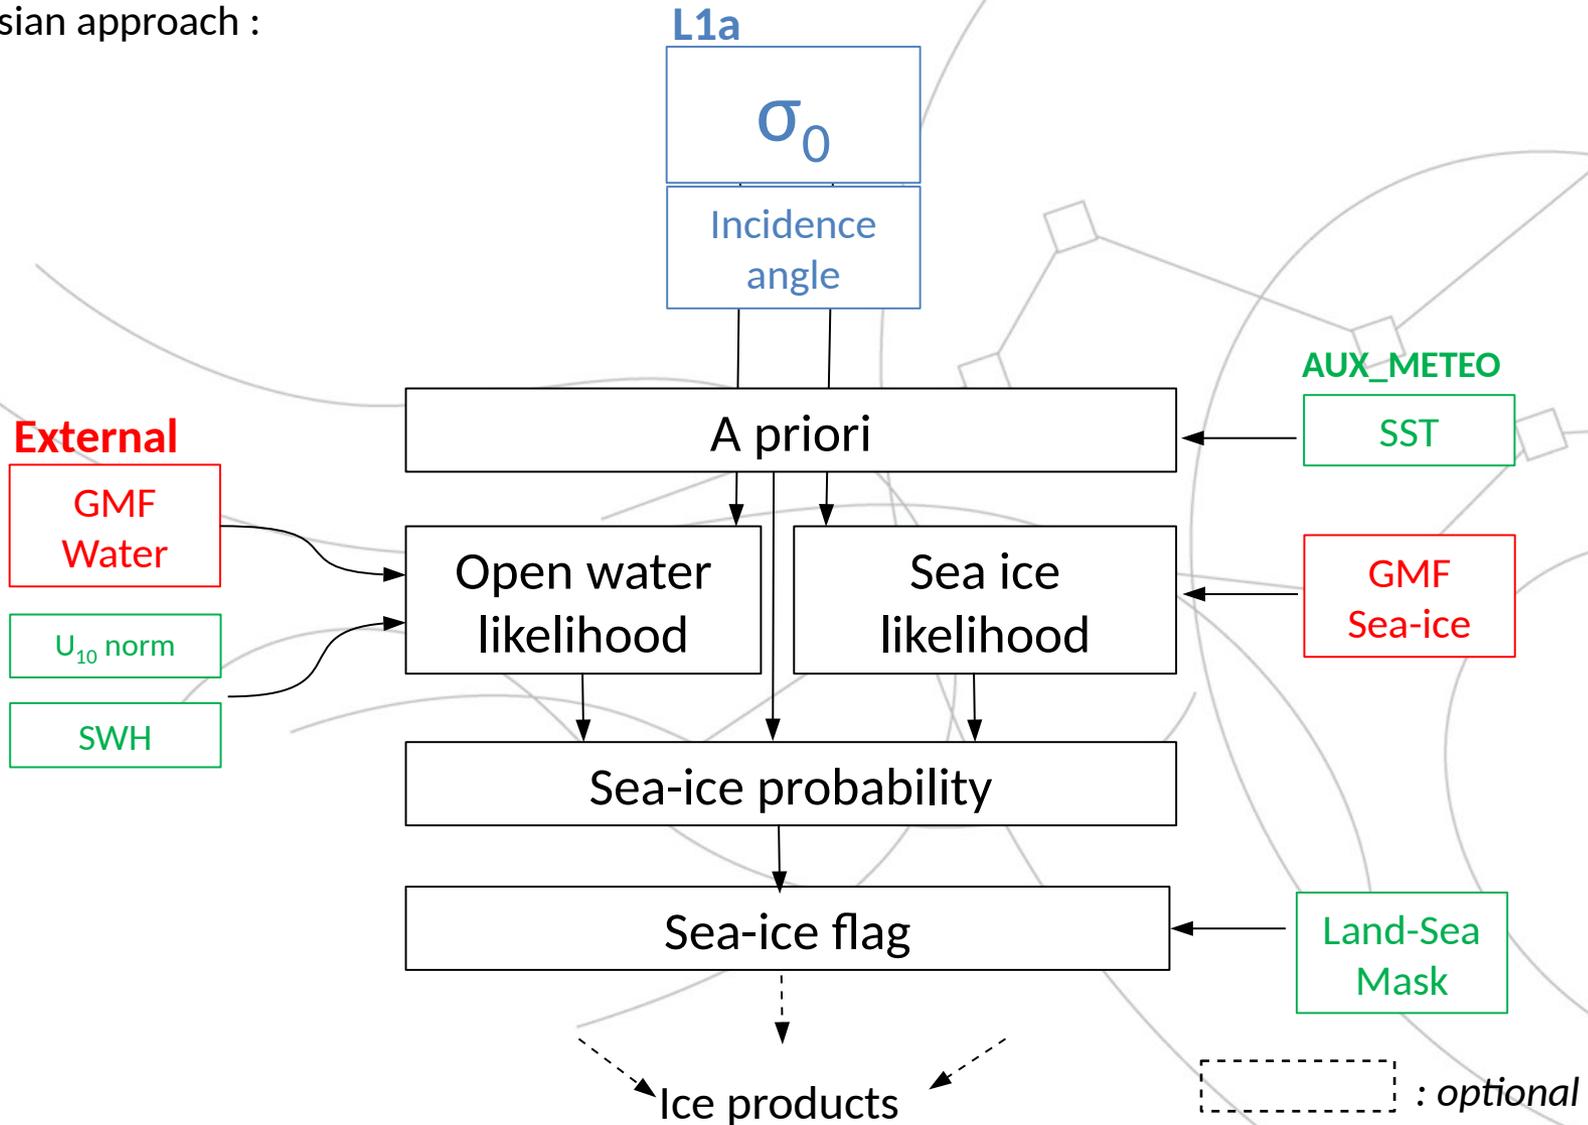

SWIM Cycle 34 (01/2020)

- Flag = 1 if sea-ice
- Flag = 0 else
- Log-likelihood

# Algorithm overview

Bayesian approach :

# Algorithm overview

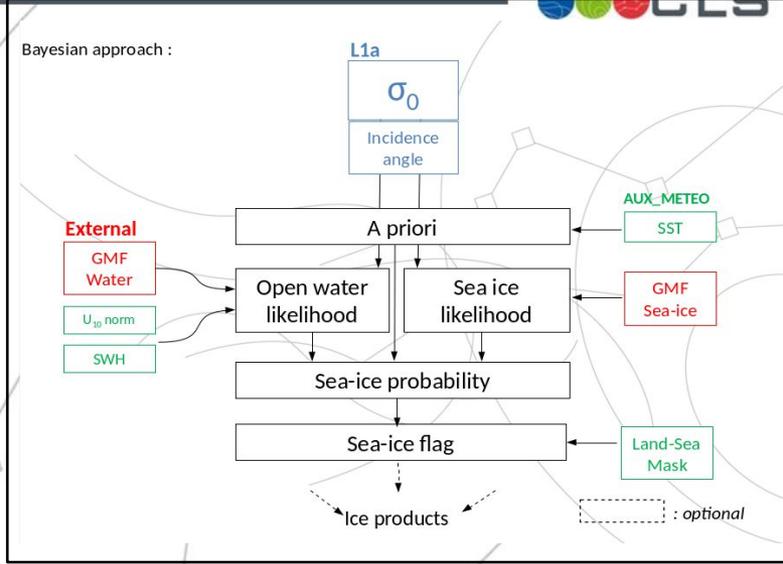

A probability is defined

where land-sea mask = 0 :

$\geq 0.5 \rightarrow$  **SI flag = 1**

$< 0.5 \rightarrow$  **SI flag = 0**

$$P(\text{ice}) = \frac{p(\text{ice}|\sigma_0)}{p(\text{ice}|\sigma_0) + p(\text{water}|\sigma_0)}$$

which compares A Posteriori probabilities (Bayes)

$$p(\text{ice}|\sigma_0) = \frac{p(\sigma_0|\text{ice})p(\text{ice})}{p(\sigma_0)}$$

**Likelihood**
**A Priori**

$$p(\text{water}|\sigma_0) = \frac{p(\sigma_0|\text{water})p(\text{water})}{p(\sigma_0)}$$

**Likelihood**
**A Priori**

where likelihoods are derived from L1a GMFs :

$$p(\sigma_0[\text{dB}]|\text{ice}) \sim \mathcal{N}[\text{GMF}_{\text{ice}}(\theta), \Delta\sigma_{\text{ice}}(\theta)]$$

$$p(\sigma_0[\text{dB}]|\text{water}) \sim \mathcal{N}[\text{GMF}_{\text{water}}(\theta, U_{10}, H_S), \Delta\sigma_{\text{water}}(\theta, U_{10})]$$

## In brief :

2 fully analytical GMFs (+ standard deviations)

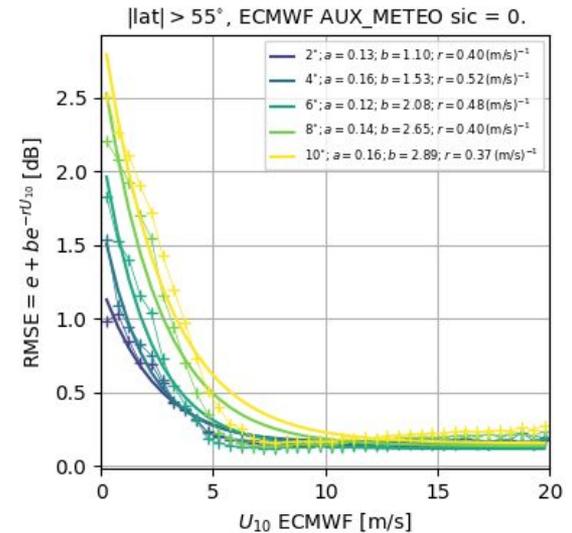

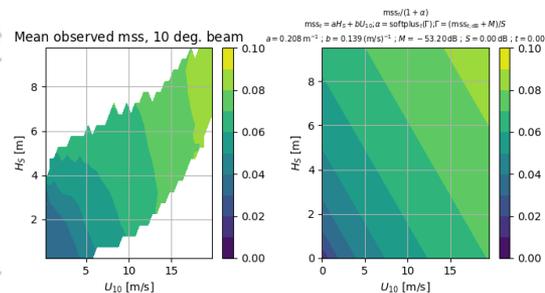

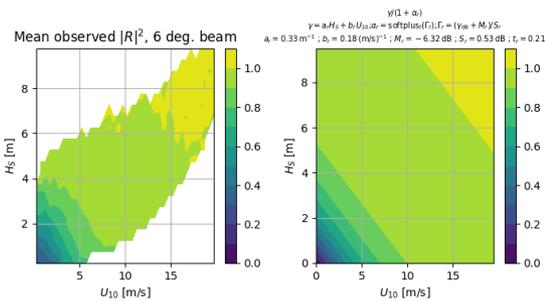

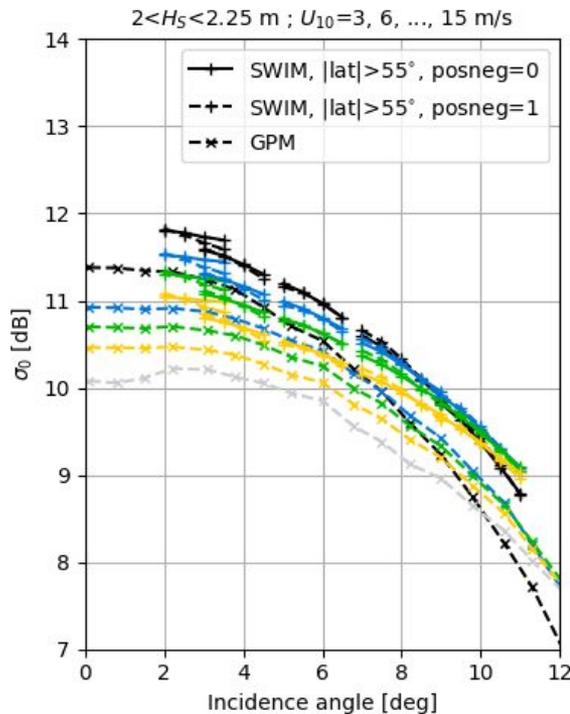

- Open water
- Sea-ice (SIC >0.9 and no land)

Estimated from **L2** mini-profiles at latitudes above 50°N and below 50°S

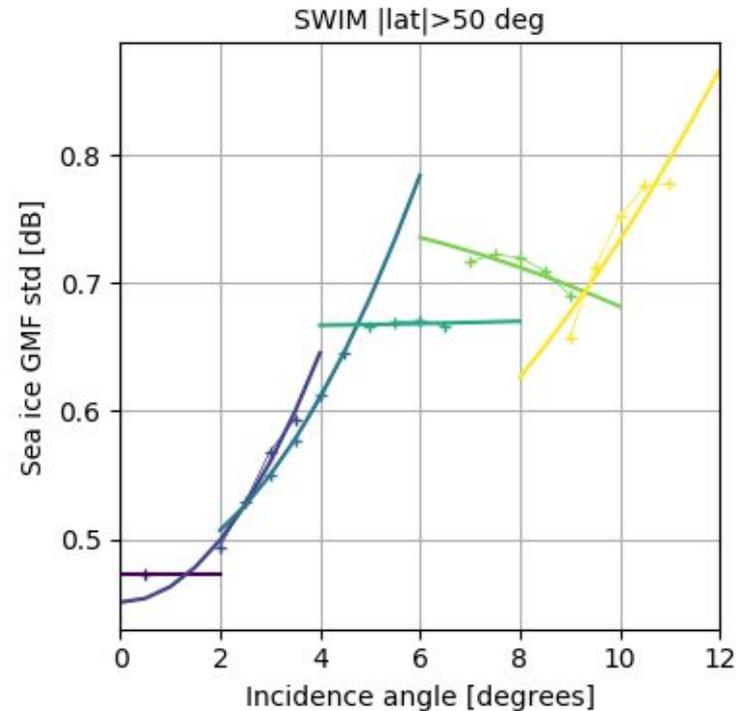

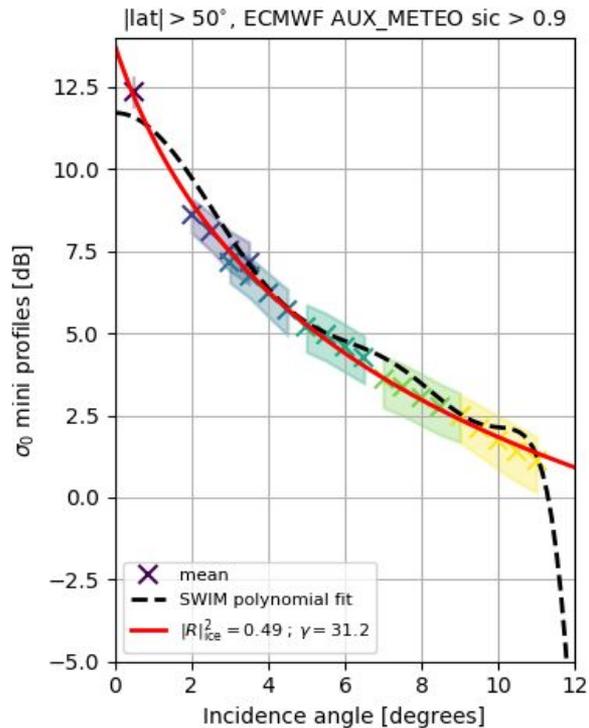

- 1 year (11/2019 to 11/2020) for sea-ice GMF
  - 4 months (07/2020 to 11/2020) for open water GMF
- and converted back to **L1a** GMFs

# Open water GMF

- $U_{10}$ ,  $H_S$ , incidence angle and beam number as variables
- Based on classical geometric optics, with physics-based parameterizations, and compared against GPM
- Fully analytical parametrizations in order to be applicable in all types of ( $H_S, U_{10}$ ) conditions

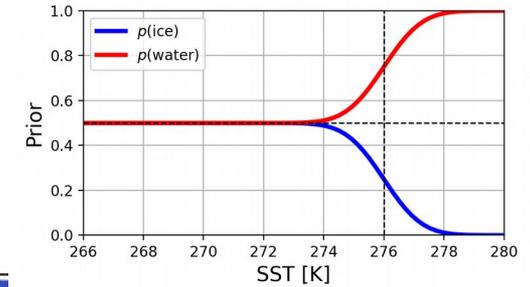

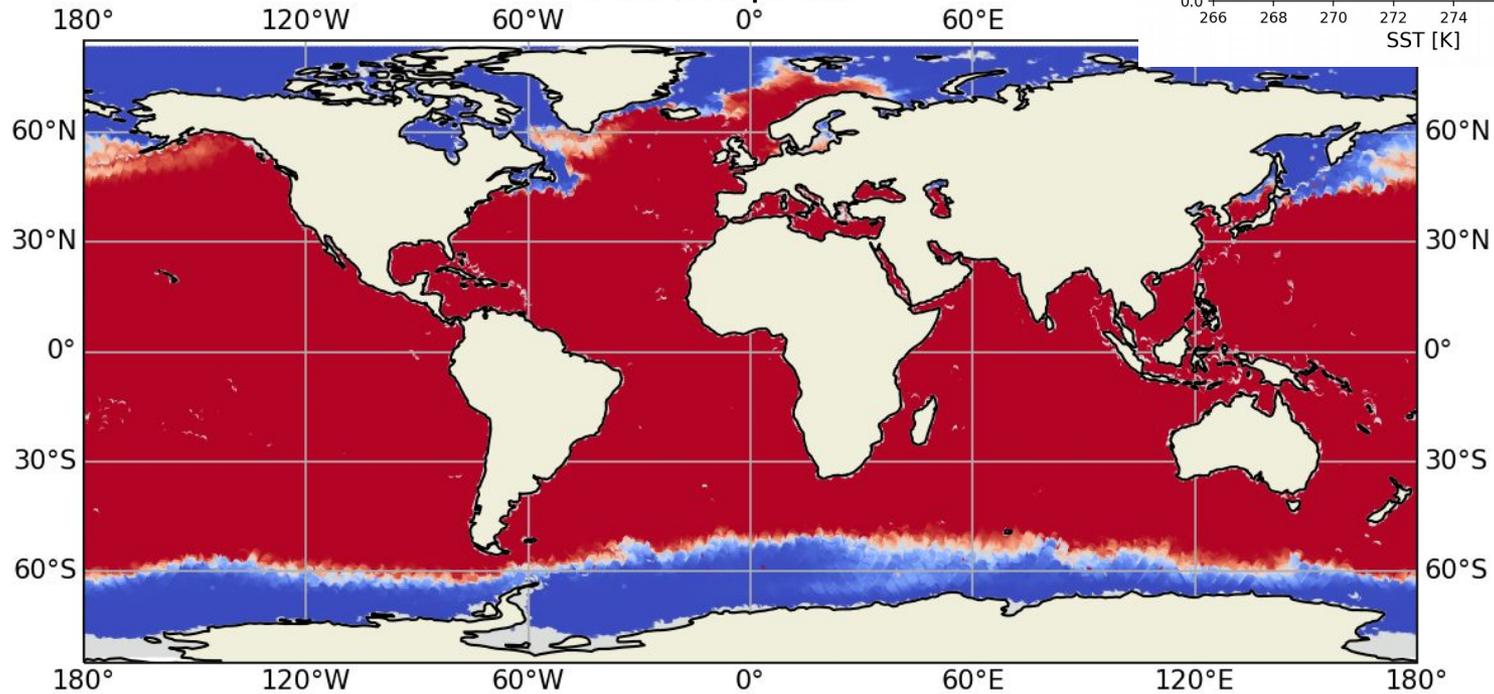

- Incidence as the only variable
- Based on previously proposed GMFs for exponentially correlated surfaces

Useful in order to avoid outliers far from polar regions

Sea-ice prior,  $4^{\circ}$

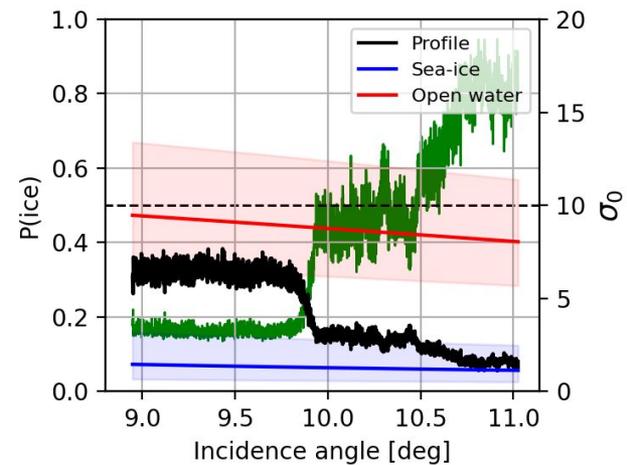

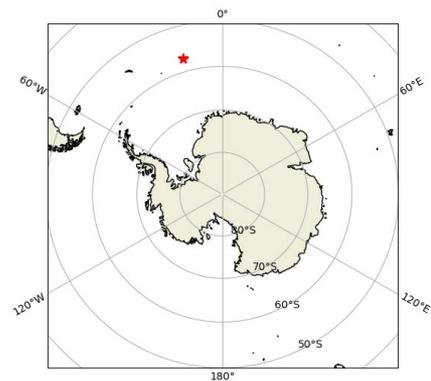

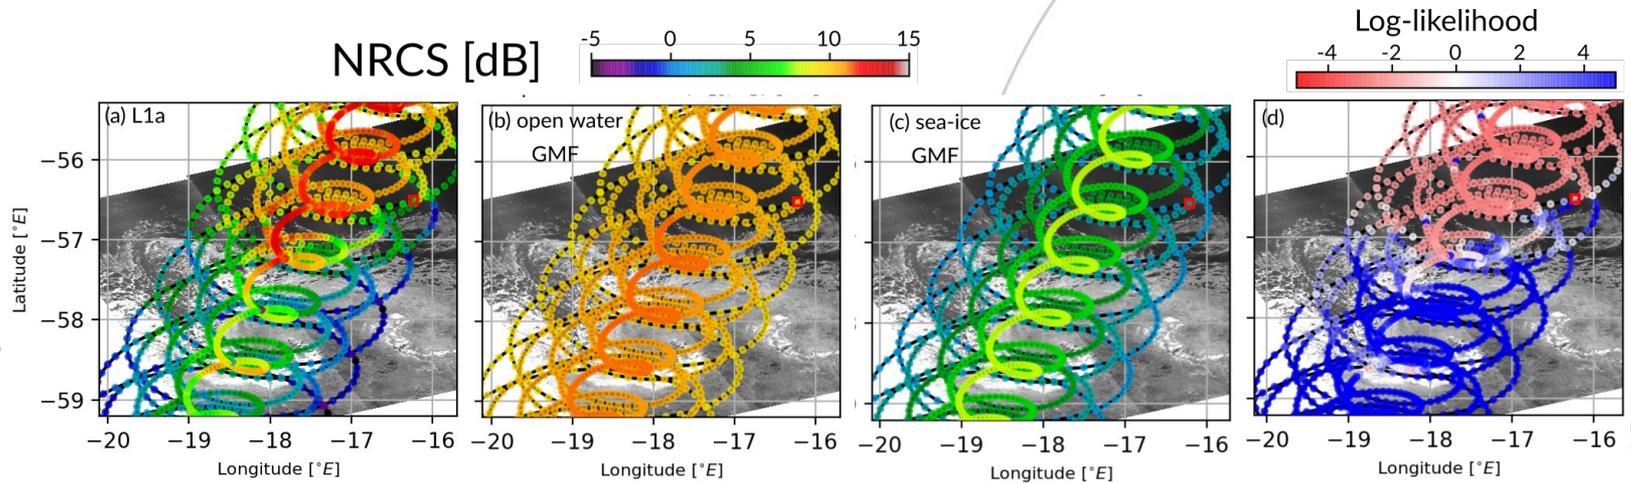

Processed over L1a  
24/02/2021 to 09/03/2021

Mid latitude outliers are penalized while cold SST areas are not favored

# Test case

Colocated with Sentinel 1 on 07/10/2020

S1B\_EW\_OCN\_\_2SDH\_20201007T202743\_20201007T202837\_023711\_02D0EF\_E580.SAFE, HV channel

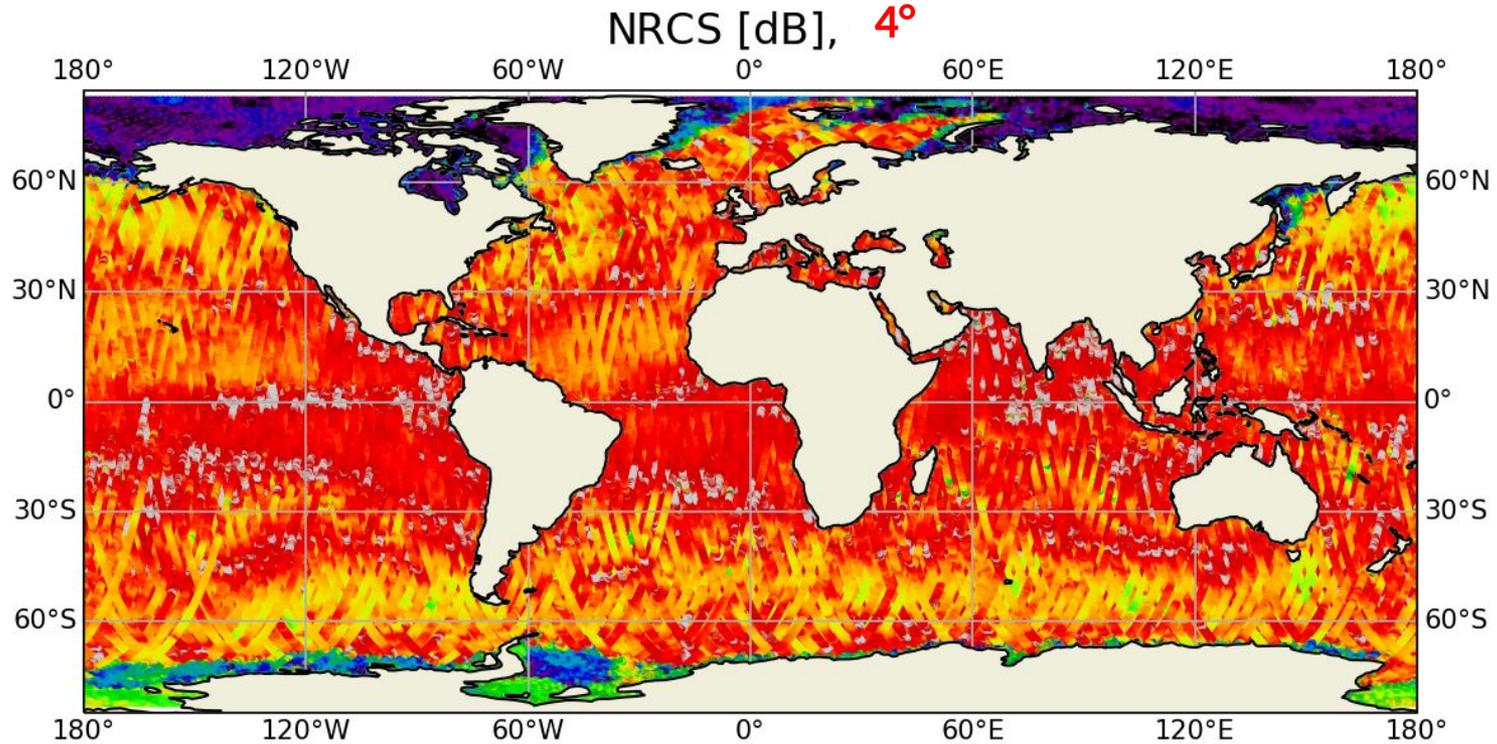

# Example output - NRCS

Averaged over individual profiles

Processed over L1a

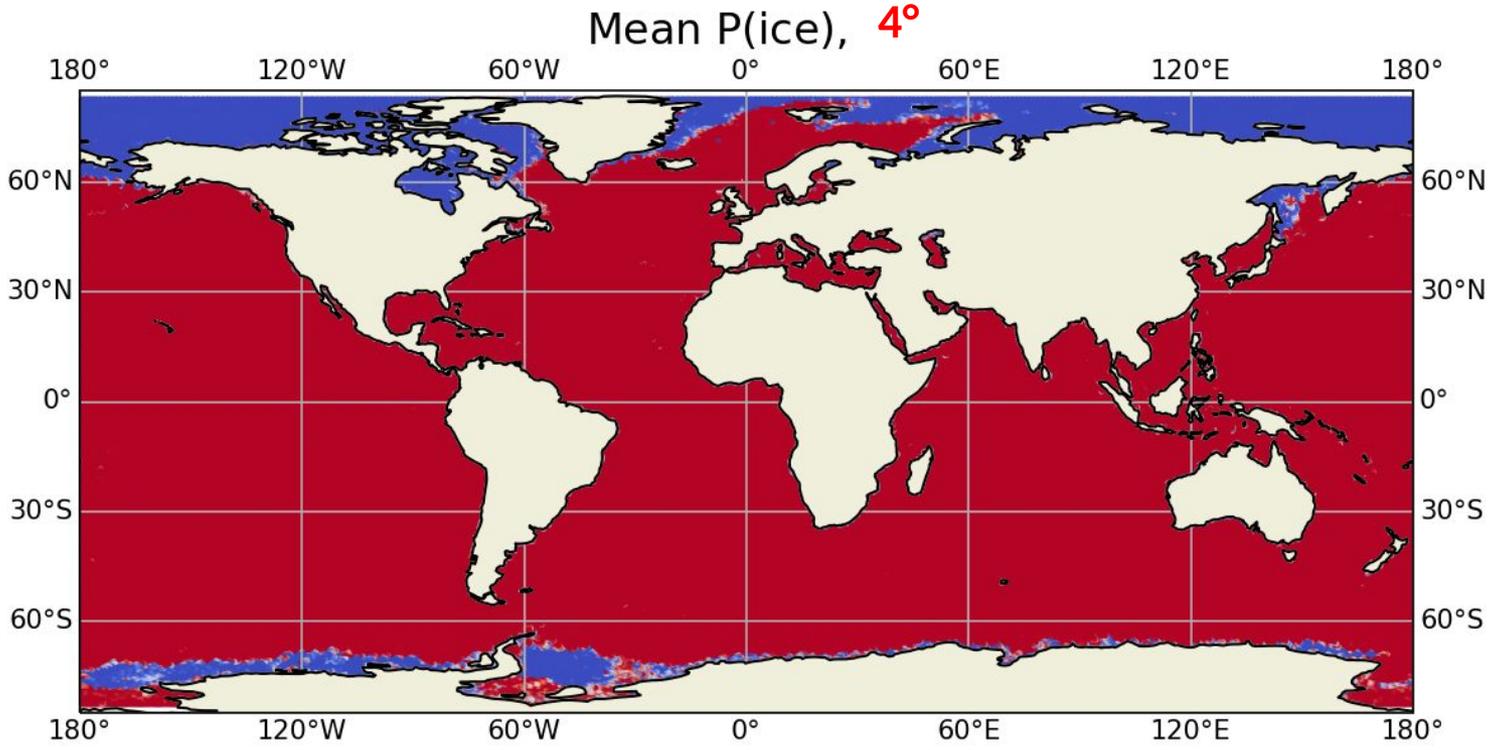

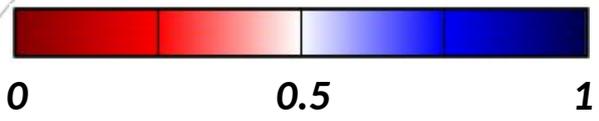

24/02/2021 to 09/03/2021

# Example output – mean P(ice)

Averaged over individual profiles

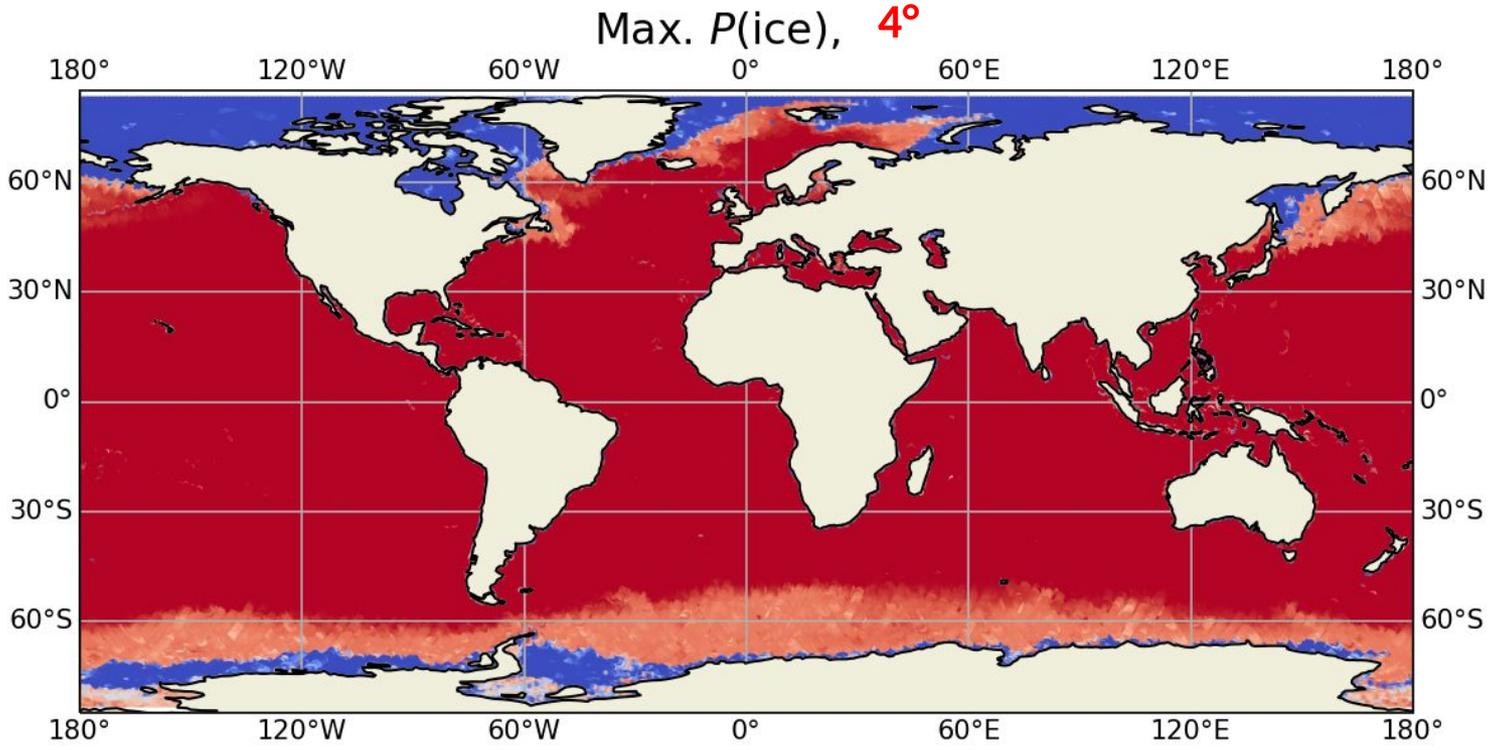

Processed over L1a  
24/02/2021 to 09/03/2021

# Example output – max. P(ice)

Averaged over individual profiles

Processed over L1a  
24/02/2021 to 09/03/2021

# Example output – comparison with SSM/I

Averaged over individual profiles

Processed over L1a  
24/02/2021 to 09/03/2021

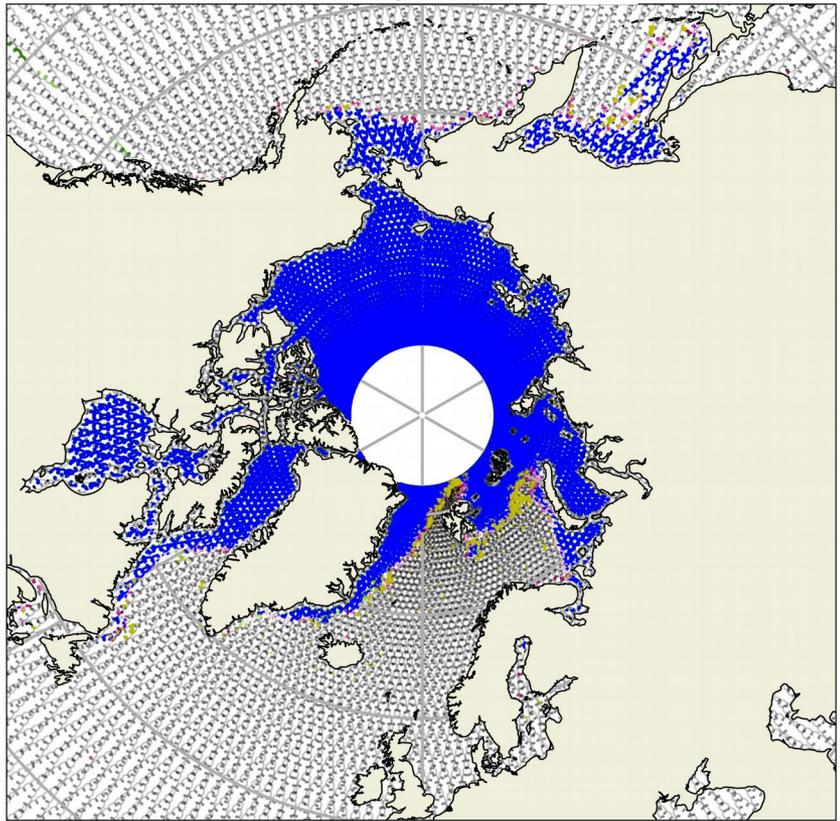

False negative SSM/I (12km) concentration

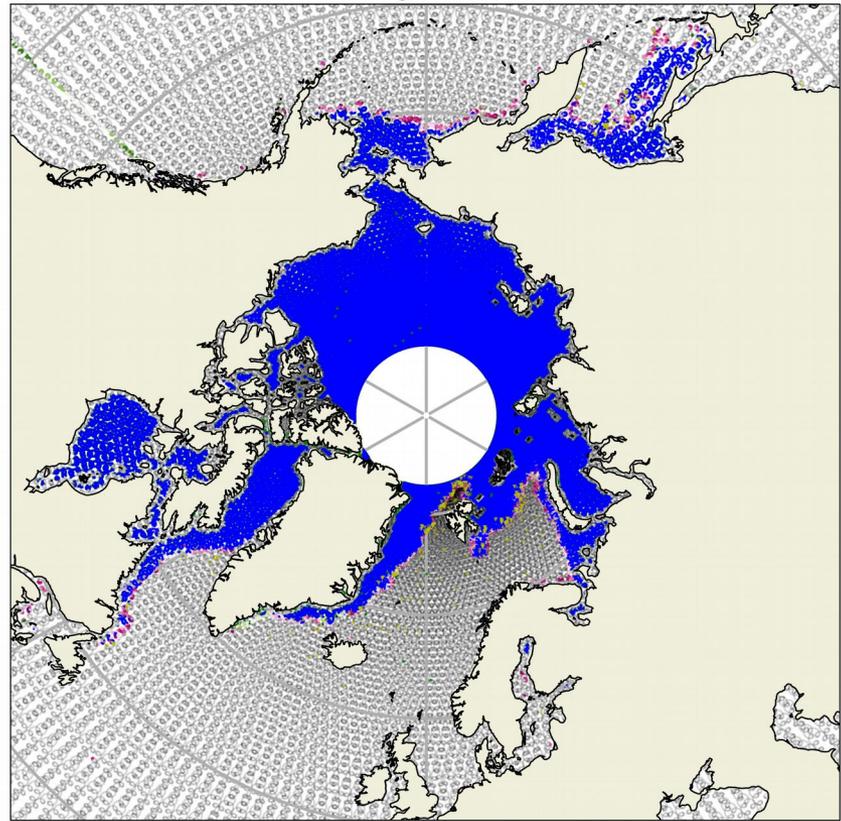

0 0.5 1

● True positive detections    ▲ False positive detections

Sea-ice flag (L2 beam), 2°

Sea-ice flag (L2 beam), 4°

# Example output – comparison with SSM/I

Averaged over individual profiles

Processed over L1a  
24/02/2021 to 09/03/2021

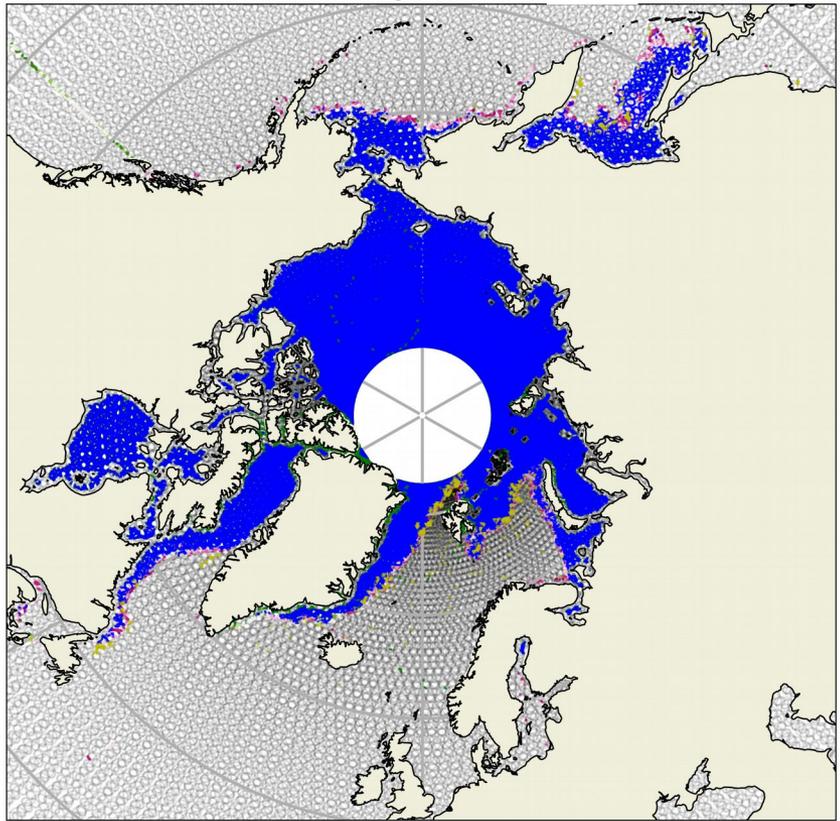

False negative SSM/I (12km) concentration

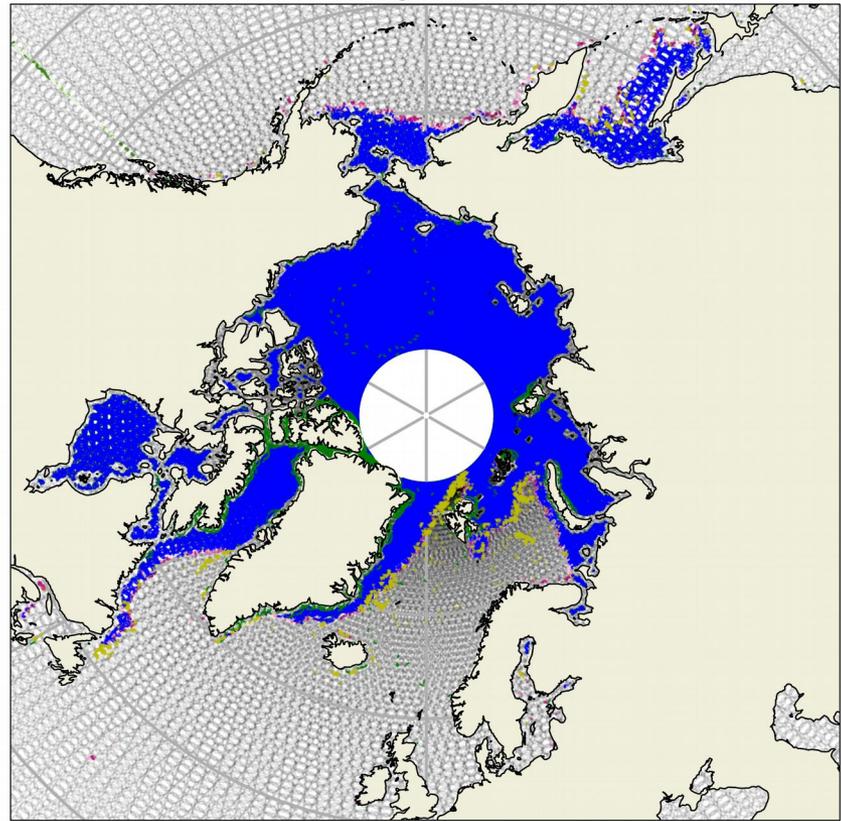

0 0.5 1

● True positive detections    ▲ False positive detections

Sea-ice flag (L2 beam), 6°

Sea-ice flag (L2 beam), 8°

# Example output – comparison with SSM/I

24/02/2021 to 09/03/2021

● True positive detections    ▲ False positive detections

False negative SSMI (12km) concentration

Sea-ice flag (L2 beam), **6°**

Sea-ice flag (L2 beam), **10°**

## **Mature open water & sea-ice GMFs**

- Fully analytical
- Comparison with GPM

## **Sea-ice flag with good performances**

- No pollution of low latitudes
- Compared with SSMI
- Performances from beam to beam being qualified

## **Possible improvements**

- Sea-ice derived products
- Potential for further improvements and better characterization of sea-ice (GMF)

→ Publication to be submitted for CFOSAT special issue
